

The Brain Eating Amoeba is Back! Is Your Water Safe?

DAWN
'Brain eating amoeba' claims life of 14-year-old in Karachi.
A 14-year-old boy died in Karachi after drinking tap water, a doctor has said. The boy, who was in good health, died after a week of illness. The doctor said the boy had a rare brain-eating amoeba infection. The amoeba is found in untreated water and can cause a fatal infection. The boy's family said they had not noticed anything unusual about the water. The doctor said the boy had a rare brain-eating amoeba infection. The amoeba is found in untreated water and can cause a fatal infection. The boy's family said they had not noticed anything unusual about the water.

DAWN
'Brain eating amoeba' Water samples show chlorine below required level
Water samples show chlorine below required level. A group of scientists has found that the chlorine level in water samples from Karachi is below the required level. The scientists said that the chlorine level is too low to kill the brain-eating amoeba. The amoeba is found in untreated water and can cause a fatal infection. The scientists said that the chlorine level is too low to kill the brain-eating amoeba. The amoeba is found in untreated water and can cause a fatal infection.

Chances of survival from Brain Eating Amoeba are < 1%
